

Having a venogram

This leaflet explains what happens during a venogram – a special X-ray to look at the veins in one or both of your arms.

What a venogram?

The doctors looking after your kidneys are considering you for creation of an AVF (arteriovenous fistula – a direct surgical connection made between an artery and a surface vein). This will create a large vein into which needles can be inserted to allow your blood to be passed through a dialysis machine to replace the function of the kidneys.

In preparation for this, the doctors have asked you to have a “venogram”. The venogram will be performed in the X-ray department and usually takes approximately 30 minutes. Occasionally, your appointment may be delayed if there are any emergencies in the X-ray department.

What will happen?

You will be taken into the X-ray room and asked to lie on the x-ray table. The table is a little high but there is a step to help you. The radiologist (the X-ray doctor) will put a cannula (a small needle) into a vein in your hand or arm. Through this a special dye called ‘contrast’ will be given, to allow your veins to show up on the X-rays. If you are allergic to iodine please let your nurse know as soon as possible.

Whilst the X-ray pictures are being taken, the machine will move above your arm and will make some clicking noises as it is moved. It is essential that you keep still whilst the pictures are being taken. There will be x-ray staff in the room with you throughout the procedure. They will wear special aprons to protect them from the X-rays that they are frequently exposed to.

Are there any side effects?

Some people do notice that they feel hot when the contrast is given or they experience a strange taste in their mouth. Both these symptoms pass quickly and are not anything to worry about.

If you are a pre-dialysis patient, then you may require some additional care to protect your remaining kidney function from the contrast (dye). If this applies to you, please see the enclosed letter for full details. You can eat and drink normally before and after the procedure. The venogram will not affect your driving if you are driving yourself to the appointment.

When will I get the results?

Once the procedure is complete, the cannula will be removed from your arm and you will be able to get up and leave. It is unlikely that you will be given any results at the time as the x-rays will need to be studied and a report written. This will be sent to Oxford for the surgeon who will create the fistula. If you would like to know the results, please contact the nurses in the area relevant to you (see contact list overleaf). It will be a few days before the results become available.

What if I have any questions?

If you have any questions or concerns; or if you require hospital transport, please contact the nurses in the area relevant to you.
