

Having a musculoskeletal, neck or testicular ultrasound

This leaflet explains what happens during an ultrasound examination in the Radiology (X-ray) Department at the Royal Berkshire Hospital. The examination is conducted either by a radiologist (specialist X-ray doctor) or a sonographer (specialist in ultrasound).

Before the ultrasound

There is no need to follow any preparation.

A radiology department assistant will greet you in the ultrasound area and one may be present during your examination.

No childcare facilities are available while you have your scan so please make alternative arrangements.

If you would like a chaperone for the examination, please speak to a member of staff in the ultrasound department.

What is an ultrasound?

An ultrasound scan uses high frequency soundwaves to create an image of your body.

Ultrasound uses non-ionising radiation and is therefore considered a safe test.

What happens during the ultrasound?

Ultrasound gel is placed on an ultrasound probe, which is then moved over the skin of the area to be examined. The lights are dimmed to allow the examiner to see the ultrasound screen more clearly. Most examinations last between 10 to 15 minutes.

After the ultrasound

Following the scan, you can wipe off the gel and leave immediately.

Results

We will send a report of your examination to your referring doctor; if this is a hospital specialist, then the specialist will contact your GP with the report.
