

Hydrogen and methane breath test (adult patients)

This leaflet explains the breath test, what is involved and how to prepare for it. If there is anything you do not understand, please ask a member of the team.

What is a hydrogen and methane breath test?

It is a non-invasive, safe, painless and simple way to diagnose conditions that cause gastrointestinal symptoms. The two most common conditions are:

1. **Lactose intolerance:** Lactose is the sugar found in milk. Individuals who are unable to properly digest lactose are referred to as 'lactose intolerant'.
2. **Small bowel bacterial overgrowth:** This is a condition where there are greater than normal numbers of colonic bacteria in the small intestine.

Both of these conditions may cause abdominal pain, bloating and distension, wind and diarrhoea.

If you need a lactose breath test, the small bowel bacterial overgrowth breath test will be done first. A separate appointment will be scheduled for the lactose breath test, as these tests are not done during the same hospital visit.

How is the test performed?

The test involves blowing into a small tube attached to a machine. After a first sample has been taken, you will be asked to drink a sugary solution. Further breath samples will then be collected in the same way as the first one. Samples will be taken every 15 minutes for the first 90 minutes and then every 30 minutes for the remaining time. The test will last between three and four hours.

During the test, you should **not** eat, drink, smoke tobacco products or vape, sleep or exercise.

You may like to bring a book, magazine or computer with you.

The monitor is very sensitive to alcohol vapours. On arrival and throughout the test, wash your hands with soap and water but **do not use hospital gel, which contains alcohol.**

How do I prepare for the test?

- Do not have anything to eat for 14 hours before the test. During this time, sips of water only.
- Do not consume alcohol 12 hours prior to test or use alcohol-based mouthwash.
- On the day prior to the test avoid milk and products such as onions, leeks, garlic, cabbage, beans or any pickled vegetables.
- The last meal on the day before the test should not be large and should ideally not contain any dietary fibre, e.g. bran, whole wheat bread or beans.
- Examples of suitable meals include scrambled eggs on toast, plain rice and chicken or pasta, but **see the food examples section (page 2) for more guidance.**
- Stop smoking and chewing gum 12 hours before the start of the test.
- Medicines (apart from vitamins, laxatives, motility-enhancing drugs) can be taken with plain water on the day of the test. Multivitamins should stop the day before.
- Laxatives, in particular lactulose as well as probiotics, should be discontinued for at least one week prior to the start of the test.

- Please brush your teeth on the day of the test. **Do not use alcohol-based mouthwash.**
- On the day of the test, please try to open your bowels (have a poo) prior to appointment.

Please inform a member of staff if you have:

- Taken antibiotics within the last 4 weeks.
- Had a colonoscopy within the last 4 weeks.
- Diabetes.

Examples of foods that can be eaten 24 hours before the test

Breakfast:	<ul style="list-style-type: none">• Dry white toast (not brown bread), with / or• Scrambled eggs / poached / boiled egg (not fried eggs)• No butter or milk to be added
